1.  $\varphi$  is the off axis angle from lamp centerline where the luminous intensity is 1/2 of the peak value.
2. View angle tolerance is  $\pm 10^\circ$ .

### Forward Current vs. Forward Voltage

@ Ts = 25°C

$$I_F = f(V_F)$$

### Relative Luminous Intensity vs. Forward Current

@ Ts = 25°C

$$I_V/I_{V(5mA)} = f(I_F)$$

### Relative Forward Voltage vs. Junction Temperature

@ I<sub>F</sub>=5mA

$$\Delta V_F = V_F - V_F(25^\circ C) = f(T_j)$$

### Relative Luminous Intensity vs. Junction Temperature

## 10. Precaution for Use

### 1. Over-current-proof

Customer must apply resistors for protection; otherwise slight voltage shift will cause big current change (burn out will happen).

### 2. Assemblies

Do not stack assemblies containing LEDs to prevent damage to the optical surface of LEDs. Forces applied to the optical surface may result in the surface being damaged.

### 3. Soldering Condition

3.1 When soldering, do not put stress on the LEDs during heating.

3.2 After soldering, do not warp the circuit board.

### 4. Soldering Iron

Each terminal is to go to the tip of soldering iron temperature less than 350°C for 3 seconds within once in less than the soldering iron capacity 25W. Leave two seconds and more intervals, and do soldering of each terminal. Be careful because the damage of the product is often started at the time of the hand solder.

### 5. Repairing

Repair should not be done after the LEDs have been soldered. When repairing is unavoidable, a double-head soldering iron should be used (as below figure). It should be confirmed beforehand whether the characteristics of the LEDs will or will not be damaged by repairing.
