Technical drawing of a 5-pin connector. The top view shows a rectangular body with five pins. Dimensions include a total width of $8.0^{+0.3}_{-0.0}$, a pin pitch of 4.0 , and a pin diameter of $\phi 1.5^{+1.0}$. The distance from the left edge to the first pin is 2.0 ± 0.05 . The distance between the first and second pins is 4.0 . The distance between the second and third pins is 1.35 . The distance between the third and fourth pins is 4.0 . The distance between the fourth and fifth pins is 1.35 . The distance from the right edge to the fifth pin is 4.0 . The distance from the top edge to the center of the pins is 3.05 . The distance from the top edge to the bottom edge of the body is 1.75 . The distance from the bottom edge to the center of the pins is 3.5 ± 0.05 . A polarity symbol is shown on the left, indicating the positive (+) and negative (-) terminals. A cross-section view on the right shows the internal structure and a dimension of 1.2 for the body thickness.

Precautions for Use

1. Over-current-proof

Customer must apply resistors for protection, otherwise slight voltage shift will cause big current change (Burn out will happen).

2. Storage

2.1 Do not open moisture proof bag before the products are ready to use.

2.2 Before opening the package: The LEDs should be kept at 30°C or less and 90%RH or less.

2.3 After opening the package: The LED's floor life is 1 year under 30°C or less and 60% RH or less.

If unused LEDs remain, it should be stored in moisture proof packages.

2.4 If the moisture absorbent material (silica gel) has faded away or the LEDs have exceeded the storage time, baking treatment should be performed using the following conditions.

Baking treatment : 60±5°C for 24 hours.

3. Soldering Condition

3.1 Pb-free solder temperature profile

3.2 Reflow soldering should not be done more than two times.

3.3 When soldering, do not put stress on the LEDs during heating.

3.4 After soldering, do not warp the circuit board.

4. Soldering Iron

Each terminal is to go to the tip of soldering iron temperature less than 350°C for 3 seconds within once in less than the soldering iron capacity 25W. Leave two seconds and more intervals, and do soldering of each terminal. Be careful because the damage of the product is often started at the time of the hand solder.

5. Repairing

Repair should not be done after the LEDs have been soldered. When repairing is unavoidable, a double-head soldering iron should be used (as below figure). It should be confirmed beforehand whether the characteristics of the LEDs will or will not be damaged by repairing.
